

O-SIGHT: LOCAL-FIRST FINANCIAL INTELLIGENCE DASHBOARD

OPay National Innovation Challenge Application 2026

1. Executive Summary

With Nigeria's current macroeconomic pressures, personal budgeting and transactions analysis to guide financial actions has become a necessity. While millions of Nigerians conduct daily transactions using digital wallets like OPay, they struggle to answer a basic question: *Where did my money go?*

O-Sight is a privacy-first, local-first financial intelligence dashboard that automatically parses raw bank statement exports (starting with OPay Excel statements) and converts messy transactional lines into structured, visual, and actionable financial insights.

2. The Problem

Modern fintech apps have made transferring money seamless, but monitoring spending remains broken:

- a) Cryptic Transaction Narration: Descriptions on statements are often unreadable, showing generic labels like "Transfer to 8031 ..." or "Third-Party Merchant Order".
- b) The Security/Trust Gap: Existing budgeting apps require users to link their live bank accounts. Due to security concerns and unstable bank APIs in Nigeria, users are highly reluctant to share credentials.
- c) Sweeps & Mismatches: Standard apps count internal transfers (e.g., saving money in O*Wealth*) as outflow, distorting the user's true income-to-spending ratio.

3. Proposed Solution & Architecture

O-Sight is designed as a local-first application. Instead of linking live credentials, the user simply drags and drops their exported OPay Excel statement into the dashboard.

- a) Fuzzy NLP Cleanups: Our backend uses string distance algorithms to resolve "Evil Twins" (e.g., consolidating "BOLT RIDES", "BOLT GIG", and "Bolt" into a single merchant category).
- b) Hybrid Mask Resolution: Restores masked recipient accounts by referencing previous full transaction hashes.
- c) Intelligence Engines: Computes a Financial Health Score based on savings rates, spending diversity, USSD/bank charge ratios, and income stability.
- d) No Database Storage: The files are processed entirely in-memory and are deleted instantly when the tab is closed, guaranteeing absolute data privacy.

4. Target Market & Economic Relevance

Our core audience consists of Gen Z, young professionals, freelancers, and micro-merchants (aged 18–35) who transact heavily on fintech platforms. With over 40 million smartphone users in Nigeria, the potential market size for user-friendly financial tracking is massive. By flagging micro-leakages (like cumulative USSD charges and airtime overspending), O-Sight directly improves financial literacy and budgeting discipline, aligning with Nigeria's digital economy goals.
